[jbrady@entecheng.com](mailto:jbrady@entecheng.com)

# **Steve Riley, PE – NE MD Client Manager**

## **John Brady, PE – Hydraulic Modeler**

**Engineering Consultant for NE MD since 2010**

- **Metering Project provides higher level of data**
- **Powerful data that can be used to accurately allocate water demands**

### **Presentation Topics**

- **Meter Replacement Project**
- **Hydraulic Modeling Overview**
- **Manipulating Meter Data**
- **Graphical Information System (GIS)**
- **Customer Meter Units**
- **Conclusion**

# North East, MD The Town

---

- Location: Headwaters of Chesapeake Bay

# North East, MD The Town

---

- Location: Headwaters of Chesapeake Bay
- Nearby: Elk Neck State Park, Turkey Point Light House
- Once occupied by Shawnee Indians
- 1658: Settled by English
- 1850: Town of North East incorporated

# North East, MD The System

---

- 2 Surface Water Treatment Plants
- Elevation Range: sea level to 400'+
- 3 Elevated Tanks
- 2 Ground Level Tanks
- 5 Major Pressure Zones
- Production: 650,000 GPD
- Customers: Residential, Commercial, Industrial, Institutional

# Meter Project

## Water Meter Replacements

---

- Entire system, minus approximately 150 meters
- 2,600 Sensus iPERL AMR/AMI Water Meters
- Primarily in Meter Pits

# Meter Project

## Water Meter Replacements

---

### Project Objectives

- Update old tired water meters
- Improve reading accuracy (reads as low as .1 to .3 gpm)
- Eliminate manual meter reading routes
- Automatically collect and log system and customer data

# Meter Project

## Water Meter Replacements

---

### Benefits

- Latitude/Longitude meter locations
- Prevents tampering
- Detects system leaks
- Remote management, monitoring, and diagnosis
- No lead content and no moving parts

# Meter Network

---

- Flex Net Managed Data
- 2 towers required for system
- Approximately 150 meters read manually

# Hydraulic Model Project Overview

---

## Objectives

- Hydraulic model representative of field conditions
- Update pipe network
- Determine:
  - System operational procedures
  - Pressure zone connectivity
  - Accurate tank and pump information
  - System Water Demands

Solutions

# WaterGEMS

Intelligent decisions for water distribution

[Home](#) > [Products](#) > [Hydraulics and Hydrology](#) > [WaterGEMS](#)

## Water Distribution Analysis and Design Software

# Hydraulic Model Project Overview

---

## Components

- Junctions or Nodes: elevation, water demand, connectivity, ...
- Pipes: diameter, material, age, C-factor, ...
- Tanks: base, minimum, initial, and overflow elevations, physical attributes, ...
- Valves: variety, from check valve to complex flow control valves
- Pumps: pump curves, efficiency information, ...

# Hydraulic Model Project Overview

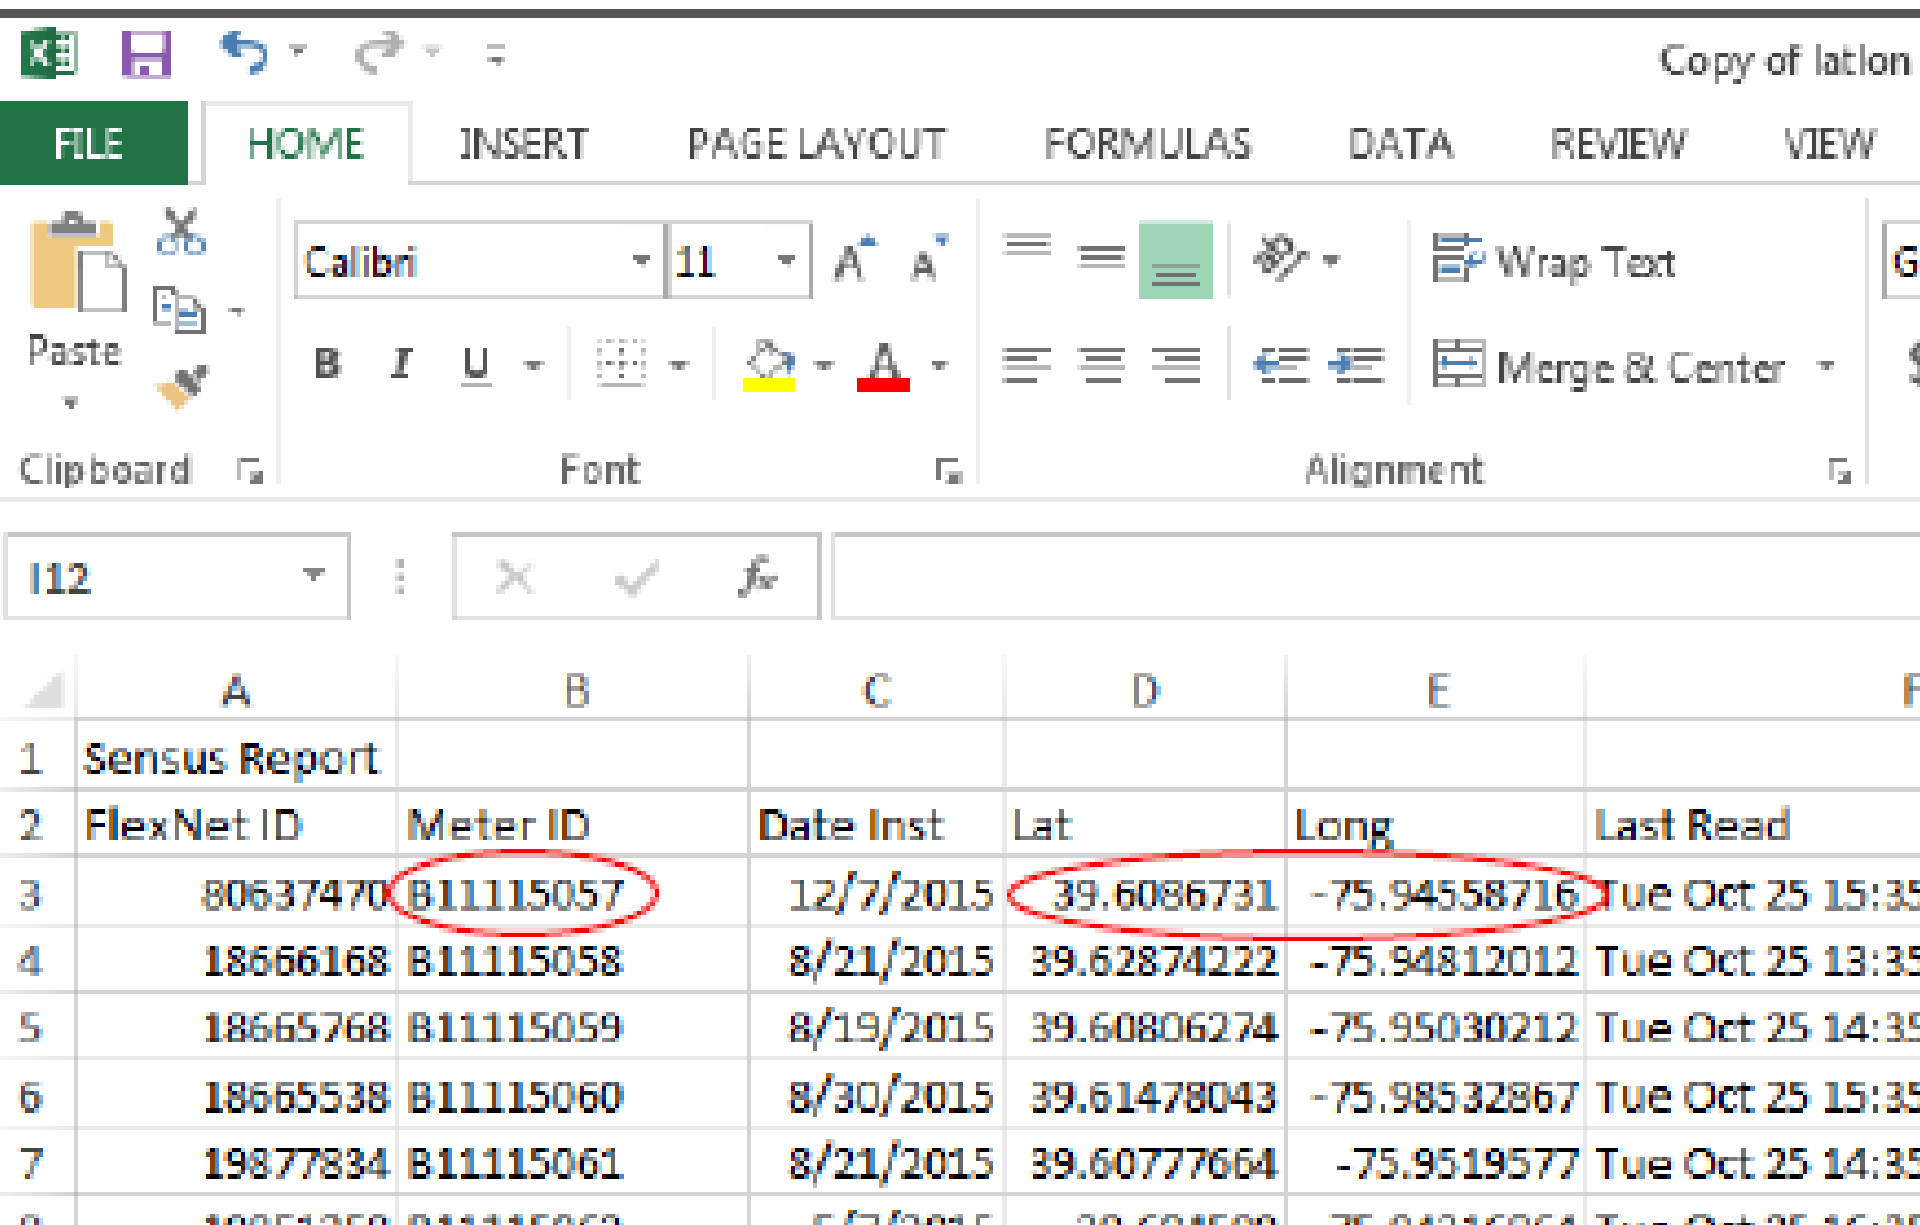

---

## **Demand Allocation - Methods**

- Split daily demand equally throughout system nodes
- Proportional distribution based on area population
- Determine largest users, enter manually at nearby node, split remaining demand among system nodes
- Use meter routes to split equally in localized node areas
- Determine each customer's usage from recent readings and manually insert meter symbols
- Import water meter data file to locate and assign most recent meter data into the model

## Meter Manufacturer Data

# GIS Shape File Preparation

---

- Meter locations: excel spreadsheet table
- Spreadsheet imported into ESRI ArcGIS software
- Latitude/longitude in decimal degrees to map meter locations
- Mapped locations converted to ESRI shapefile with Maryland State Plane 83 coordinates
- Meter ID ,Customer ID, Customer Name, Customer Address information preserved in GIS Conversion
- Shapefile output from ArcGIS for direct import into WaterGEMS software

# Hydraulic Model

Load Builder – Customer Meter Units

# Hydraulic Model

Load Builder – Customer Meter Units

# Hydraulic Model

Load Builder – Customer Meter Units

# Notable Items

---

## Meters

- About 150 meters are not part of AMR/AMI system, require manual readings
- Non AMR/AMI meters - data manually entered
- Data reviewed/refined to eliminate “bad” and duplicate data

## Data

- Time to manipulate into the model in meaningful way
- Now easy to update system demands with model in the future

# Notable Items

---

## **Unaccounted for Water**

- Approximately 20%
- Allocation assigned as even distribution amongst all system nodes

## **Calibration**

- Respectable calibration uses best known or available data
- Using the best available water usage information is one piece
- Calibration: ongoing process & effort, revisit periodically

## **Global Edits**

- Customer Meter Unit demands: globally edited from Model table

# Project Summary

---

- Bentley WaterGEMS Software Customer Meter feature allows for water usage demand allocation of each customer assigned in the Model
- Information from billing software may be exported and manipulated into a usable form to import into a hydraulic model to automate the allocation process
- With the Customer Meter feature in place, the water demand data can be updated at the Owner's desired frequency
- Applying the actual water meter reading data in the model provides a high level of confidence in the Model water demand allocation

# Conclusion

---

- NE MD meter replacement project led to a higher level water allocation capability in their hydraulic model that can be easily updated as often as they desire
- The high level water allocation data will provide improved results for the Town to make informed decisions on system improvements, particularly with water quality issues
- Higher confidence in the model results can guide the Town to efficient problem resolutions, potentially saving them money on unnecessary infrastructure and improvements
